

Experimental Principles of Optical Receivers

Overview

The SPIE Digital Library offers a comprehensive range of content on receivers, encompassing various aspects of their design, function, and application across multiple fields, particularly in optics and photonics. The library includes research articles, conference proceedings, and technical papers. Experimental results demonstrate that the receiver achieved a maximum emission efficiency of 81% at 1530. To overcome this challenge, we have proposed and experimentally demonstrated a receiver with shared-complexity between optical and digital domains that enables 80 km transmission reach below KP4 FEC limit for a 32 GBd on-off keying signal. The optical stage consists of optical filters that slices. Converting the optical energy emerging from the end of a fiber into electrical signal. various noises and distortions will unavoidably be introduced due to imperfect component responses.
