

How to wire indoor electrical distribution boxes

Article Overview

Wiring an indoor distribution box involves connecting the main power supply to protective devices and distributing it safely to subcircuits with proper phase, neutral, and earth connections.

Key Components of a Distribution Box

- Main Isolator (DP Switch): Acts as the main switch to manually open or close the power supply.
- RCCB/RCD: Protects against current leakage and electric shock by isolating circuits during faults.
- MCBs (Miniature Circuit Breakers): Protect individual subcircuits from overloads and short circuits.
- Neutral and Earth Links: Distribute neutral and earth connections to all subcircuits.
- Fuses or Surge Protectors: Optional devices for additional protection against overcurrent or voltage spikes .

Step-by-Step Wiring Process

- Preparation and Safety
- Ensure the main power is switched off before starting.
- Use insulated tools and wear protective gear.
- Verify the distribution box is rated for indoor use and matches the load requirements
