

What size router is best for fiber broadband

Article Overview

For fiber broadband, you need a router that supports multi-gig speeds, modern Wi-Fi standards (Wi-Fi 6 or 7), and sufficient coverage for your home or office.

Key Specifications

1. Speed and Ethernet Ports: To fully utilize fiber broadband, especially plans of 1 Gbps or higher, your router should have Gigabit or multi-gigabit Ethernet ports. High-end models like the NETGEAR Nighthawk RS700S offer 10G LAN/WAN ports and support LAN aggregation for speeds up to 2 Gbps over wired connections . 2. Wi-Fi Standard: Modern fiber routers should support Wi-Fi 6 (802.11ax) or Wi-Fi 7. Wi-Fi 7 routers, such as the RS700S, provide faster wireless speeds, lower latency, and better performance for multiple devices simultaneously . Wi-Fi 6 is also sufficient for most homes, offering high throughput and improved device handling. 3. Coverage Area: Router size in terms of coverage depends on your home or office size. High-performance routers can cover 3,500 sq. ft. or more and handle up to 200 devices simultaneously . For larger homes, consider tri-band routers or mesh systems to eliminate dead zones . 4. Device Capacity and Features: Fiber routers should handle multiple devices without performance drops. Look for routers with MU-MIMO, OFDMA, and tri-band support for optimal performance in smart homes, gaming, or streaming environments . Advanced security features like WPA3 encryption and built-in protection against malware are also recommended. 5. No Modem Needed: Fiber broadband uses an Optical Network Terminal (ONT), so you do not need a separate modem. Ensure your router has a Gigabit WAN port to connect directly to the ONT
